# [Tests][CI] contrib LaTeX tests fail instead of skipping when dependencies missing #8013

## Describe the issue

When running `python -m pytest cirq-core/` some tests in cirq.contrib failed when LaTeX dependencies are missing or partially installed, instead of being skipped. The error is (when grep with error/warning string the outputs):

```
ubuntu@fuzzer-03:~/git/try/H-Fuzz$ ./Cirq/script.sh
cirq-core/cirq/contrib/quantikz/circuit_to_latex_render_test.py:41: AssertionError
!!! pdflatex failed on run 1 (exit code 1) !!!
! LaTeX Error: File `standalone.cls' not found.
!  ==> Fatal error occurred, no output PDF file produced!
       os_error = None
           except (OSError, IOError) as e:
               # Use FileNotFoundError when python 2 is dropped
               os_error = e
               if os_error.errno == errno.ENOENT:
           except subprocess.CalledProcessError as e:
               # For all other errors print the output and raise the error
               except (OSError, IOError, subprocess.CalledProcessError):
                       except (OSError, IOError) as e:
                           # Use FileNotFoundError when python 2 is dropped
               CompilerError(
E          pylatex.errors.CompilerError: No LaTex compiler was found

```

Then, after trying to install LaTeX/TeX packages, it works a little bit better (but I assume it was not the full right installation):

```
cirq-core/cirq/contrib/quantikz/circuit_to_latex_render_test.py:42: AssertionError
stdout = b'Latexmk: This is Latexmk, John Collins, 26 Dec. 2019, version: 4.67.\nRule \'latex\': The follow

```

Some documentation in some deep subfolder helps to resolve it, but it takes some effort to find it:

```
cirq-core/cirq/contrib/quantikz/circuit_to_latex_render.py:            "On Ubuntu/Debian: `sudo apt-get ins
```

However, it will be a good idea to add it in the main README.

## Expected Result:

Not to crash if there are missing install, either suggest exactly how to install the missing packages or add a skip:

**[Suggested Fix]** Nonetheless, **the best practice** is likely to skip when one of the LaTeX/TeX dependencies is missing, adding something like this:

```
pytest.mark.skipif(shutil.which("pdflatex") is None, ...)
```

## Tell us the version of Cirq where this happens

I use Cirq from source version: `commit 9888067c5c36b4505917de57f0528c53882ec240`
Python: Python 3.11.11

You can get the Cirq version you are running by using Python
to print the value of `cirq.__version__`. From the command line:

```
python -c 'import cirq; print(cirq.__version__)'
```

This prints:

```
(.venv) ubuntu@fuzzer-03:~/Cirq$ python -c 'import cirq; print(cirq.__version__)'
1.6.1
```

## Reproducing the error:

I used this script:

```
ubuntu@fuzzer-03:~/git/try/H-Fuzz$ cat Cirq/script.sh
#!/bin/bash
cd ~/Cirq
source .venv/bin/activate
which pdflatex
python -m pytest cirq-core/ | grep -e"Crash" -e"Failed" -e"FAILED" -e"failed" -e"error" -e"crash" -e"warnings" -e
```

initially, without the installation of LaTeX/TeX, and then trying to install it using the hints I have found in the documentation of Cirq.
